

A FEW WORDS ABOUT EPISCIENCES

Episciences offers a publishing platform for overlay journals. Overlay journals are quality assured journals whose content is deposited in one or more open access repositories. In other words, the journal is “only” providing a certification layer (through traditional peer-review) to papers located on open access repositories. The content is therefore visible right at the time of the deposit (the peer-review taking place *after* the actual publication).

Consequently the paper benefits from a high visibility right from the onset, whatever the duration of the review process. The research results also stay available independently of the certification outcome and last but not least the overlay publication system facilitates the management of versions, if new elements validating or invalidating the results are discovered.

AUTHORS' INSTRUCTIONS

In order to submit an article to [journal name], the author must follow the following steps.

Submission

- First authors must upload their manuscript on an open access repository (arXiv, HAL or CWI).
- Then if they have no account on the Episciences platform, they must create one (“create an account” tab in the top right corner of the screen).

- First name, surname, a valid email address, a login and a password are required.
- After logging in onto the platform, authors go to the “my submissions” section and click the “submit a paper” tab.

[Submit an article](#)
[My Account▼](#)
[Journal management▼](#)

[Submit an article](#)

- Metadata are automatically retrieved by the system, the article can be submitted to the journal.

Medves, Maud and Romary, Laurent - EAG(CENDARI): customising EAG for research purposes

EAG(CENDARI): customising EAG for research purposes

Authors: Medves, Maud and Romary, Laurent

This paper presents the work carried out within the EU Cendari project to provide an appropriate customisation of the EAG format that would fulfil the expectations of researchers in contemporary and medieval history describing where they could find collections and documents of specific interests. After describing the general data landscape that we have to deal with in the Cendari project, we specifically address the data entry and acquisition scenario to identify how this impacts on the actual data structures to be handled. We then present how we implemented such constraints by means of a full TEI/ODD specification of EAG and point out the main changes we made, which we think could also contribute to the further evolution of the EAG setting at large. We end up providing a wider picture of what we think could be the future of archival formats (EAG, EAD, EAC) if we want them to be more coherent and more sustainable at the service of both archives and researchers.

In case of a request for modifications

When authors have been notified that their paper needs to be modified, they can work on it and then submit the new version to the journal.

From that point, there are two options.

1. The first option is to update their entry on the open access repository. The workflow is the following one:

- update the entry on the chosen repository by uploading the amended version.
- connect to the Episciences platform, click “answer this request” on the paper’s page and select “upload a new version”.

Berthaud, Christine and Capelli, Laurent and Gustedt, Jens and Kirchner, Claude and Kevin, Loiseau *et al.* - EPISCIENCES - an overlay publication platform

EPISCIENCES - an overlay publication platform

Authors: Berthaud, Christine and Capelli, Laurent and Gustedt, Jens and Kirchner, Claude and Kevin, Loiseau and Magron, Agnès and Medves, Maud and Montell, Alain and Riverieux, Gaëlle and Romary, Laurent

This paper delineates the main characteristics of the Episciences platform, an environment for overlay peer-reviewing that complements existing publication repositories, designed by the Centre pour la Communication Scientifique directe (CCSD) service unit. We describe the main characteristics of the platform and present the first experiment of launching two journals in the computer science domain onto it. Finally, we address a series of open questions related to the actual changes in editorial models (open submission, open peer- review, augmented publication) that such a platform is likely to raise, as well as some hints as to the underlying business model.

Modification requests

Last request : (June 25, 2014)

Mais dites, j'ai déjà vu ça quelque part. Ce ne serait pas du plagiat ?!

Answer this request ▾

Answer without any modifications
 Send a temporary version
 Upload a new version

- indicate the paper's identifier, the repository (both haven't changed and are displayed by default) and the new version.

The screenshot shows the Episciences.org website with a modal dialog box titled "Upload a new version". The dialog box contains the following information:

- Modification request:** (June 25, 2014 - 6:17 PM)
- Text:** Mais dites, j'ai déjà vu ça quelque part. Ce ne serait pas du plagiat ?!
- Required fields:**
 - Document identifier ***: hal-01002815
 - Version**: 1
 - Repository**: Hal (dropdown menu)
- Buttons:** Search, Cancel, Submit

The background shows a paper page with the title "EPISCSCIENCES - an overview" and authors "Berthaud, Christine and Ca...". The "Answer this request" dropdown menu is open, showing options: "Answer without any modifications", "Send a temporary version", and "Upload a new version".

- the amended paper is sent to the editorial team for another peer-reviewing round.

2. The second option is to submit a temporary version of the amended paper (without any upload on the repository).

- connect to the Episciences platform, click "answer this request" on the paper's page and select "send a temporary version".

- this new version of the paper won't be available on the repository, it is only saved on the Episciences platform.
- please note that when the paper is validated by the editorial board, you will have to upload the final version on the repository before the final acceptance.

The paper is stamped and its bibliographical references (such as the journal's name) are automatically updated on the open access repository. The paper becomes also visible on the journal's website.
